Mohamad Safieddine, Project Portfolio

Nov 10, 2026 · @Mohamad Safieddine

I design, build and launch digital products: I set the vision, write the requirements, test with real data and manage the release. OOF, my car meet app, has been live on the App Store since May 2026, Deep Mine, a 3D iOS game, is in App Store review, and FinanceFlow is a quoting tool I built for Performance Lexus. I work with generative AI every day, Claude above all.

Below: each product at a glance, the skills my work shows, and the story behind each one.

At a glance

Five products: four iOS apps, from a social app to a 3D game, and a quoting tool for a car dealership. Ratings are from the Canadian App Store on November 10, 2026.

Product	What it does	Built with	My role	Status
OOF - Car meets	Find car meets near you, sorted by distance, and connect with the local car scene	React Native, Expo, Firebase, GitHub	Founder and builder, published under my own developer account	Live since May 21, 2026
Deep Mine: Dig and Upgrade	3D mining game with eight worlds, tool upgrades, daily rewards, trophies and outfits	Unity, C#, App Store Connect API, Claude Code, GitHub	Product owner and builder	Version 1.0 in App Store review; update 1.1 in progress

Product	What it does	Built with	My role	Status
WordHaven: Word Puzzle Creator	Build word puzzles and share them by link or code, with a daily puzzle and a story mode	iOS	Co-founder; UI designer, sound and level creator	Live since March 12, 2026; 5.0 stars from 8 ratings
Spensei: Spending Tracker	Logs each Apple Pay purchase on the phone and shows what is safe to spend today, with no bank login	iOS, Apple Shortcuts	Co-founder	Live since July 5, 2026, now version 1.5; 5.0 stars from 12 ratings
FinanceFlow	Builds a car buyer's finance product menu in four packages, with payments, and prints it as a customer-ready PDF	Offline web app in one file: React, TypeScript, Vite, Claude Code	Built it for Performance Lexus, through my company, Bluegill Innovations	Demo approved by the dealership; version 1.2, October 2026

What I can do

Each row is a skill and where I have used it on a real product. I can walk through any of them in an interview.

Skill	Where I have used it
Product vision and roadmap	Planned the Deep Mine launch and the roadmap for update 1.1 (two new worlds, an in-app shop, a holiday event). Kept a ranked list of what was left after every change and decided what shipped.

Skill	Where I have used it
Testing and decisions from data	Set up a test bot that plays each Deep Mine world from start to finish and reports the minutes per world and when each upgrade is bought. Used its numbers to set prices and pacing. 259 automated tests run before every build.
App Store listings and discoverability	Wrote the App Store listings: name, subtitle, keywords, description, category and 20 captioned screenshots for iPhone and iPad.
Requirements and outside partners	Defined the requirements for each feature and reviewed every change against them. Worked through Apple App Review, App Store Connect, Google AdMob and Expo's cloud build service.
Releases and data migrations	Tested Deep Mine on TestFlight across several builds before submitting it. Planned save-file upgrades so players' progress carries safely into each new version. Moved Performance Lexus's spreadsheet quote menu into FinanceFlow and checked its payment math against their real menus.
Writing standards and team training	Set one writing standard for every word players read in Deep Mine: short, plain and free of jargon. As General Manager at Hasty Market (2019 to 2023), recruited, trained and supervised the team.
Accessibility	Rewrote all of Deep Mine's text in plain language and made its buttons and labels larger and easier to tap.
Generative AI	Build with Claude every day. Designed a multi-agent workflow (a planner, specialist agents, review gates and a spending cap) that planned and built two new Deep Mine worlds.
Websites (HTML and CSS)	Built and published Deep Mine's privacy policy, terms and support pages, and OOF's website, on GitHub Pages.

Skill	Where I have used it
Business and client work	Ran a convenience store as General Manager for four years and grew its revenue by 40%. Built FinanceFlow with a car dealership's finance team, shaped by their feedback over several demos.

Deep Mine: from idea to App Store review

Deep Mine is a 3D mining game for iPhone and iPad: dig down, sell what you find, buy better tools and move through eight worlds. I own the product end to end. Claude Code is my engineering partner: I set the direction, write the specs, play-test every change and decide what ships.

Four of the 20 App Store screenshots I captioned and laid out for Deep Mine.

What I did

- **Vision and roadmap.** Planned the 1.0 launch, then update 1.1: two new worlds, an in-app shop and a December gift for early players, timed so the gift reaches them before December 29.
- **Decisions from data.** A test bot plays each world from start to finish and reports minutes per world and when each upgrade is bought. After play-testing I made the rocket launcher stronger; the bot then showed one world dropping from 64 to 32

minutes, and I chose the trade-off with that number in hand.

- **Quality.** 259 automated tests run before every build, and every change is played in the real game before release. When play-testing turns up a bug, the fix comes with a test that proves it stays fixed.
- **Release management.** Shipped test builds on TestFlight, set up App Store Connect (privacy labels, age rating, pricing, availability in 148 countries) and answered an App Review request for more information.
- **Store presence.** Wrote the App Store listing and 20 captioned screenshots, and published the privacy policy, terms and support pages on GitHub Pages.
- **Automation.** Scripts talk to Apple's App Store Connect API to upload screenshots and listing text and to check review status, so updates take minutes, not hours.

By the numbers: 8 worlds, 259 automated tests, 20 store screenshots and 1 multi-agent AI workflow.

WordHaven: Word Puzzle Creator

WordHaven turns word puzzles into something people make and share. A player picks the words and a background, names the puzzle and sends it to a friend, who plays it from a link or a code.

It also has an Explore page of puzzles made by other players, a daily puzzle and a story mode, with no ads, no timers and no account needed. It has been live on the App Store since March 12, 2026, rated 5.0 from 8 ratings, published under Husein Mokbel's developer account.

My role: Co-founder. I designed the interface, coordinated the sound and created the puzzle levels.

OOF - Car meets: a community app I launched

I built OOF because local car scenes were scattered across group chats and social pages, and people drove hours without knowing what was happening in their own city. It brings meets, people and builds into one app. It has been live on the App Store since May 21, 2026, free, under my own developer account.

What it does

- **Find meets near you,** sorted by distance, with the location, date, host, car types and head count. Join in one tap.

- **The OOF Card,** each member's profile: name, city and meet stats on the front, and the car's specs and full mods list on the back.
- **Build your network** by OOF ID or by scanning a QR code in person at a meet.
- **Host a meet** in seconds, with a location, date, car types and a visibility radius.
- **A live map** of active meets around the world.

How I built it: React Native and Expo in TypeScript, Firebase for sign-in, the database and photo storage, and Expo's cloud build service to sign and upload to the App Store. The code is on GitHub (17 commits from April 19 to May 24, 2026), and the app's website is on GitHub Pages.

Spensei: Spending Tracker

Spensei is a spending coach that tells you one number: what is safe to spend today. Each Apple Pay purchase lands in the app seconds after you pay, through a one-time Apple Shortcuts setup, with no bank login. Purchases stay on the phone, not on a server.

- **Left today:** a monthly limit, or pay minus bills, turned into one number for the day, with the working shown.
- **Coaching:** a morning note on yesterday, belts for days on track, a month in review, and spending habits that add up.
- **Protection:** reminders before subscriptions renew or free trials end, and a heads-up when a shop charges twice.
- **Ask about your money:** a plain-language chat whose figures are calculated first, then explained, and that asks before sending anything.
- **Spensei Pro:** a monthly or yearly subscription with a 7-day free trial.

It has been live on the App Store since July 5, 2026, now on version 1.5, rated 5.0 from 12 ratings, published under Husein Mokbel's developer account.

My role: Co-founder.

FinanceFlow: a quoting tool built for Performance Lexus

I built FinanceFlow for the finance office at Performance Lexus, where I work, to replace the Excel sheet its managers used to build product menus for customers. It runs as one file on a dealership PC, with no server and no internet, and prints a customer-ready PDF menu.

- **The menu:** four packages side by side, with products added from a searchable catalog, dragged between packages and repriced for each deal.
- **The numbers:** monthly, bi-weekly and weekly payments with tax, using the same loan math as the dealership's spreadsheet, checked against its real menus.
- **At the desk:** a presentation mode for when the customer is sitting across from the manager.
- **Built with the client:** a first demo the dealership approved, then several rounds of changes from the finance team's own list, now at version 1.2.
- **Data and quality:** rebuilt the product catalog from the dealership's revised workbook, flagged pricing and description errors in it, and added automated browser tests for every editing path and the PDF export.

Built with React, TypeScript and Vite, through my company, Bluegill Innovations.

How I work

Every change goes through the same steps, so nothing reaches players untested or unexplained.

1. **Define it.** A short spec: what the player should see, and how we will know it works.
2. **Build it with AI.** Claude Code writes and changes the code to the spec; I review the result.
3. **Test it.** The automated tests run, then I play the change in the real game, on the screens a player would use.
4. **Record it.** The decision and the reason go into the project's documentation. Deep Mine's runs to over 500 lines, kept current with every change.
5. **Ship it.** A test build on TestFlight, then App Review, then a release I press myself.

GitHub. I keep code and websites on GitHub, including Deep Mine's full Unity project, with its tests and tools, in a private repository. OOF's source lives there (17 commits, April to May 2026), and Deep Mine's privacy policy, terms and support pages are published from it on GitHub Pages.

AI at scale. For Deep Mine's two newest worlds I ran a multi-agent workflow: a planner split the work among specialist agents for design, art, code and review, each result passed a review gate before it was kept, and the run stayed within a spending cap I set ($83 of $100).
